

Claims

- [c1] 1. A safety device used on pianos to prevent lid-slamming, comprising:
- a. A suction cup;
 - b. A rod having a first end pivotally connected to the top center of said suction cup and a second end having a rubber roller rotably affixed; and,
 - c. A stopper piece on the top center of said suction cup to control the erection angle of said rod.
- [c2] 2. The device of claim 1, wherein the first end of said rod further having a spring means to prop up said rod automatically whenever the piano keyboard lid is open.
